Structure of the Kubio Editor Interface

- The interface is divided into three main zones.

- The **left panel** contains the menu with sections for settings, styles, and element layout.

- The **central area** displays the actual page being edited by the user.

- The **top bar** allows saving, previewing, and switching between views (desktop, tablet, mobile).

- This structure enables the user to see the result of every change immediately, making the design process transparent and visually logical.
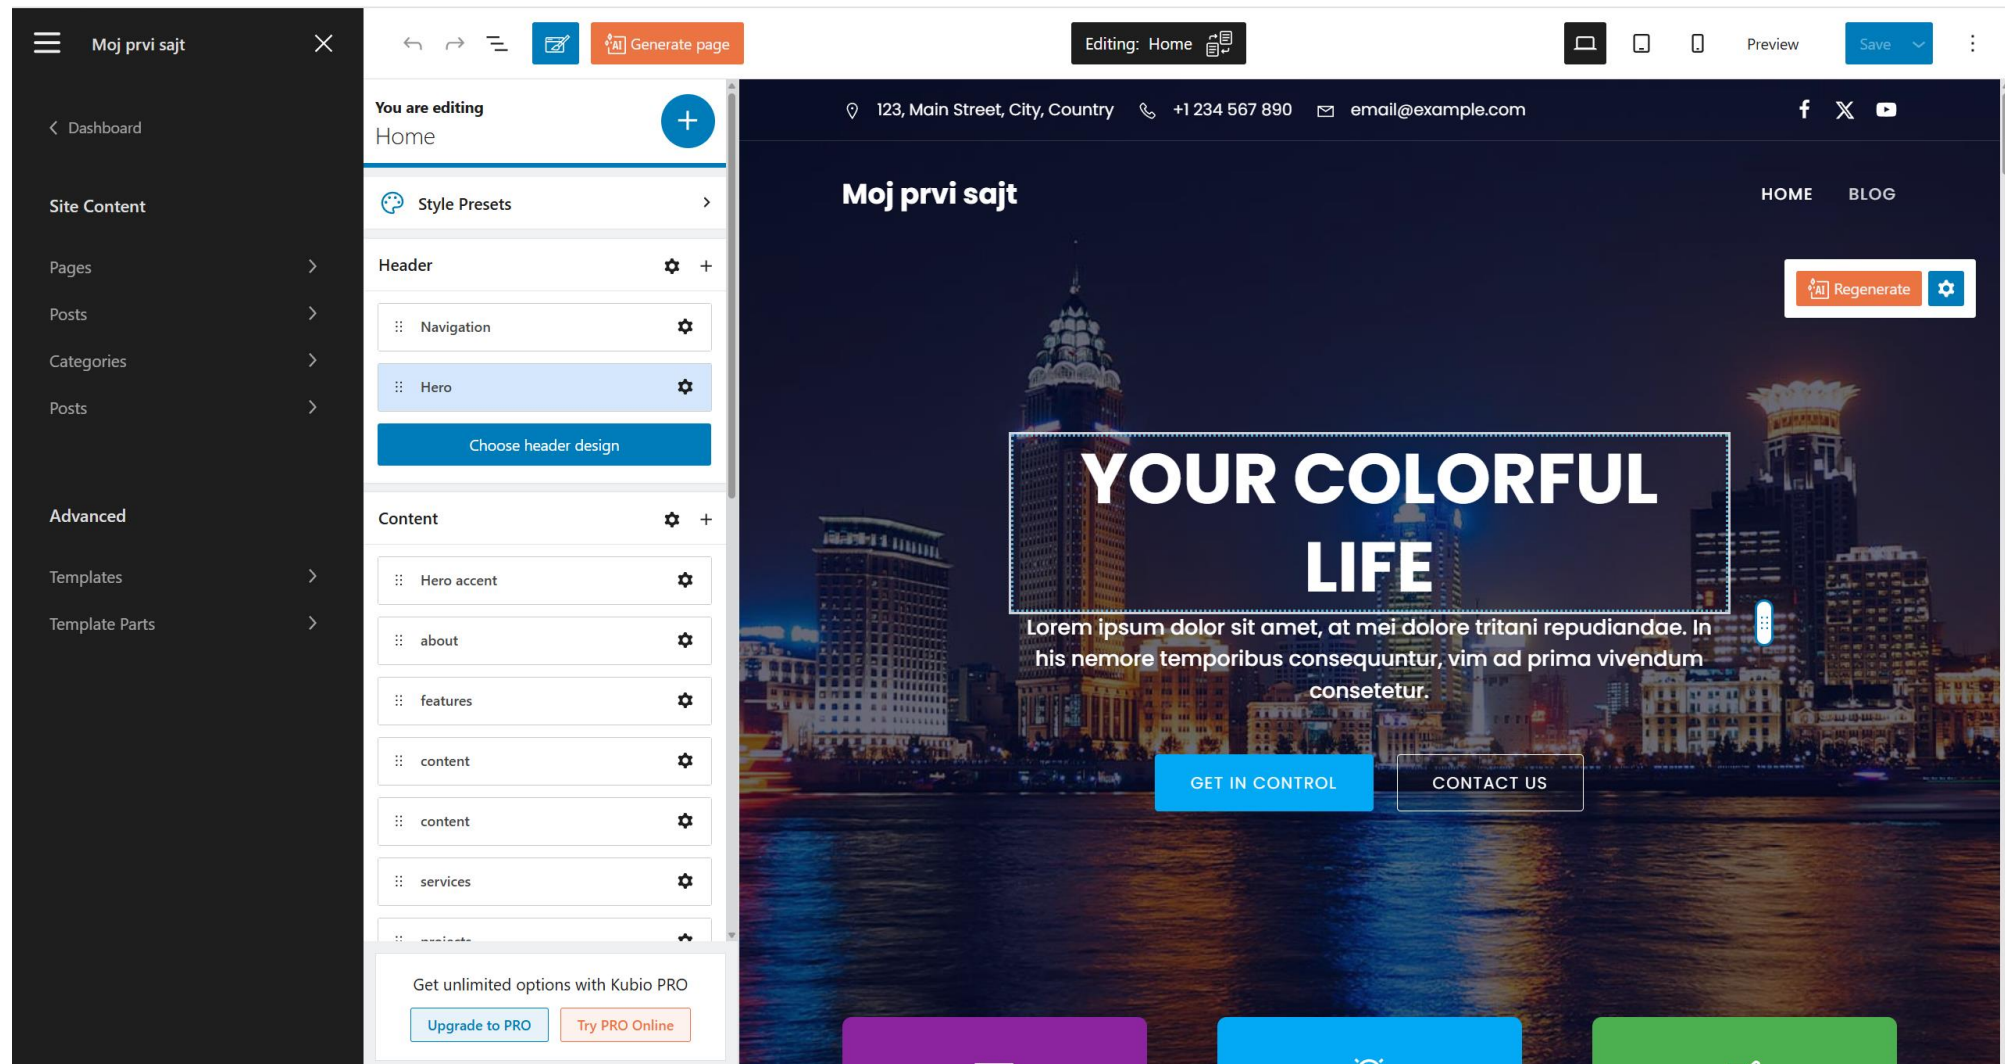

Editing the Blog – Kubio Editor

Accessing the Posts Section

- At the top of the interface, there is a **Toggle Navigation** button that opens and closes the side menu, providing more workspace.

- Within the page, three zones are clearly displayed: **Header**, **Body**, and **Footer**.

- Each zone contains separate modules that can be customised — their order, design, or content can be modified.

- **Kubio** gives the user the ability to design the structure from scratch or to use pre-made blocks as a starting point.

Appearance of the Toggle Navigation

Editing the Header

- The **Header** is the first visual segment a user sees upon opening a website.

- Within the **Header** section, it is possible to modify navigation, add a logo, background, or hero section.

- The **Choose header design** option provides a gallery of ready-made templates that can be further customised.

- The user can adjust the menu layout, font size, spacing, and colours.

- A well-designed header clearly communicates the website's identity and enables easy visitor navigation.

Editing the Header

Editing the Footer

- The **Footer** is located at the bottom of each page and represents the final element of the design.

- It usually contains basic information about the website, contact details, links to social media, or copyright notices.

- **Kubio** allows the selection of pre-designed footer templates, as well as manual addition of new columns, text blocks, or icons.

- A functional footer contributes to the professional appearance of the website and makes it easier for users to access important information.

Editing the Footer

Editing the Blog Page Content

- The **Blog** page displays posts in a list format.
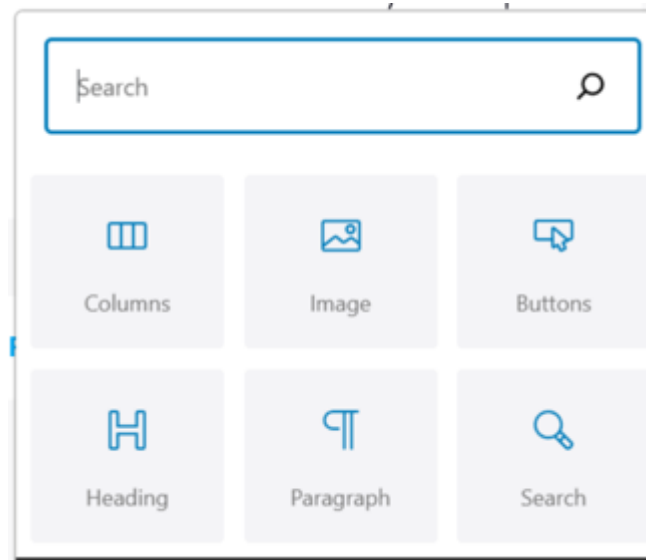

- **Kubio** allows the user to edit every part of the display: column layout, image sizes, colours, margins, and fonts.

- Clicking on any element opens its editing panel.

- The **Latest Posts** block dynamically retrieves the newest posts from the database and displays them in real time.

- In this way, the user learns how dynamic content functions within a static page.

Adding New Blocks and Sections

- Adding new elements in the **Kubio** editor is extremely simple.

- By clicking the blue "**+**" icon, a new block can be inserted (text, image, gallery, video, button, separator, list).

- Blocks can be dragged with the mouse and positioned wherever the user wants.

- They can be grouped into sections, allowing for a logical and clear organisation of content.

- In this way, each page can be completely unique and tailored to its specific purpose.

Adding New Blocks and Sections

Setting Style and Visual Identity

- The **Style Presets** section in the left panel allows the user to define the website's global visual parameters.

- Here, the main colours, typography, spacing, borders, and backgrounds are configured.

- All changes are automatically applied across all pages of the site, maintaining design consistency.

- In this way, the user creates a recognisable and professional website identity without the need to manually style each element.

Editing a Post in the Kubio Editor

- When a user opens the editor for a specific post (e.g., *Hello World!*), **Kubio** provides full control over its appearance.

- The central area displays the post structure — title, content, image, and meta information (date, author, categories, comments).

- At the top is the **hero section**, which can include a background image, the page title, and navigation.

- Through the left panel, the user can adjust the layout, typography, and colours of each part of the post, as well as replace the page header and footer.

- This approach allows the user to edit not only the text but also its **visual context**.

Customising Content Within a Post

- Each element within a post represents a **block** that can be edited independently.

- Clicking on an image, text, or button opens the side panel with detailed options — adjusting size, margins, alignment, and animations.

- The user can insert new blocks between existing sections, change backgrounds, add galleries, tables, or CTA buttons.

- **Kubio** allows each post to be visually distinct while maintaining the theme's core style.

- In this way, content becomes interactive, engaging, and professionally presented **without any additional coding**.

Previewing and Saving Changes

- **Kubio** provides an instant page preview via the **Preview** button.

- The user can check the website's appearance on different devices — desktop, tablet, and mobile.

- Once satisfied with the layout, clicking **Save** preserves all changes.

- This functionality is important because it ensures the design is consistent, responsive, and professional across all screen formats.
